

# EAGLE TAC NIGHT VISION INFRA RED TORCH

Once again I am updating the site and adding into the mix a new development that my friends in the USA use, they introduced me to this light and boy what a light it is! **INFRA RED MKII T100C2** I bought two of these lights and they are paired up to my night vision rifle scope and also my binoculars, so I have a massive amount of extra infra red light at night when scanning with my night vision binoculars, the world is mighty bright!

Here are a few pictures that show the light and my equipment. I love to sit and wait at a dead sheep that a Rooikat has killed, I sit the next evening and when he comes back, I shoot him in the dark and this infra red light helps me to see even better with my binoculars and rifle scope.

Here it is on my R4 system that I use at night and I use one on my rifle and one on my binoculars, I ordered them with the pressure switch and tail cap cover, rifle mount system and recharges. I use a LED LENSER universal mount for fitting the torch to the scope.

This shows the Infra red light fitted above my rifle night vision scope, this shows the light without a funnel to stop side leakage, below is a picture with a funnel fitted. The pressure switch is really handy for putting the torch on **quickly and quietly!**

T100C2  
Mark 2

The Eagle Tac is a mean INFRARED system that pairs up very well with 1<sup>st</sup> - 2<sup>nd</sup> and 3<sup>rd</sup> Gen night vision riflescopes; I fit a funnel to my light to stop any light leakage on the sides.

## MY TYPICAL KILL SITE EQUIPMENT

At a sheep kill site when a Rooikat has killed a sheep I employ this system to kill him!

Firstly I have three methods of operation;

NO MOON I sit at the back of the bakkie with a swivel chair like normal night hunts, IF it's a small moon quarter or less I use a trailer on its own left on the lands with a small chair on it, OR if big moons I take a low cut off table with a 10 inch leg length and put a small chair on top.

It all depends on the moon condition, the small table and chair is hard to see if he comes back on a moon. I sit 70metres from the dead sheep and scan with night vision binoculars and with this I have a HUGE 1,5 million candle power infra red spotlight, then also the two Eagle Tac infra red lights, and shoot with an Infra red laser and an Eagle Tac infra red light on my night vision rifle scope.

The set up is awesome and its like shooting fish in a barrel, I have so much light that if an animal comes close he looks like he is on fire he is so bright and clear, I called a lynx in one night and he looked like he was in flames as he was running in as he was so illuminated with infra red lights.

I sit and scan, and when I spot him coming back to the dead sheep the next night I scan, and shoot in the pitch dark, he does not have a chance, chances are they come back the next evening, you must just have patience.
