

# NIGHT VISION TIP

When you are calling for jackal, and you have prepared your truck, and camouflaged it up etc, now you are waiting for pitch darkness to start calling, this you? Is this how you operate?

**Yes? Well, if you say YES, then STOP!!! It is a huge mistake, stop now, BECAUSE when it gets to that time that you no longer can see with a human eye, from now to pitch darkness - this time, it is a time of fantastic predator and other game spotting, all the animals walk around then, and you are sitting waiting for darkness, you are missing 100% of all animals walking around, many have spotted you and bolted!.**

**Don't sit on a chair and turn with a red light, you are attracting attention to yourself, don't do that – USE NIGHT VISION alone and just observe, you will be amazed at how many things you will see in this period before pitch darkness – a time you before never could see what you missed, imagine now in the past 10 years all these times, how many animals did you fail to see, because you never used night vision! In twilight night vision works fantastic with natural light.**

**This is a small tip, but one that can help you get back home with far more predators than you did before! Use that period before total darkness to scan with normal binoculars and then swop over to NV when you no longer can see with the human eye! But not with red lights, use night vision!**

**This is just a simple thing but many guys calling do not do it and they are making a huge mistake.**

**Lekker jag!**
