

The ANSWER TO GETTING BETTER RESULTS WHEN PREDATOR CALLING

To achieve better results when you call at night you need to get on equal ground with a jackal or lynx, and even the playing fields, and **only one way will allow you to do this** – **NIGHT VISION**. The use of night vision, nagsig op jakkalse en katte – will enable you to call them easier; they come closer, come faster and come in with no visual hindrances, because you are using ZERO lights at all allows you to be in a far better position than if you used red lights.

Predators come in faster, closer, easier, quicker and more sure footed when using total night vision

I have used night vision for years now, and watched lots of animals approach a caller, you can see the animal's body language and you can tell just how he is responding to your call and stand you are standing at. This cat above I watched from 350m away coming in, at 75m he sat down with his front paws out like a dog, looked around at the caller, then at other things around him, and was totally relaxed, he had no idea I was watching him with 3 infra red lights, a huge infra red spotlight on my chair, a tactical spot on the torch on my nv binoculars, and an infra red laser also on the binocular, he just looked around and was totally unaware of any presence, I then shot him in the head and he never knew a thing.

CONVINCED

I am 100% convinced that by making use of total darkness at night, calling and scanning with NV and shooting with a night scope and by using ZERO red lights at all enables you to call in far more critters, especially cats, as cats are light shy, using a system that keeps you in the black enables you to achieve far better results, that is a fact.

I have called predators for many years and been around the block some, and I do know a few things regarding them and their ways, and one thing is for sure educated jackals will not be called in with a red light, never, they become familiar with this, only night vision will win the day.

I am not pushing night vision so I make sales, **I don't sell night vision**, I am just stating facts here, in the section **GENERAL** you will see a lot regarding the ways to call cats and good tips, read that, and remember what I say, the main things, south easter wind, no moon, before or after rain, dark nights, good camo etc are all ways to help, BUT night vision is a must.

I went with my partner to a farm once, an educated jackal was killing sheep, nobody could call him, it took us 25 minutes and he lay dead 60m from the bakkie, called and shot with nagsig, it does work!.

I am not saying calling in general is simple, I will never do that, BUT by using nagsig does help a lot and that's a fact, I have no doubt at all that by using nagsig op jakkalse en katte help moersa baie, the results speak for themselves.

LEARN TO CONCENTRATE

The only thing you must get used to is concentration, when you shoot with a normal rifle scope, the crosshair is thin and pin point accuracy is achieved, at night with night scopes, it is more of a concentration issue, and you need to concentrate a lot more on the target and keeping still etc, far more than what you did in the day with a normal scope.

I zero my 223 at 80m on an A4 piece of paper

Here is an idea as to my target and the crosshair I use, I use a V shape as it don't block out any part of an animal when aiming, the parts I need to see are visible.

This is my sight picture when viewed with my night scope.

My rifles scope has a **V** upside down - it allows me to see exactly the spot I want to put the bullet and does not cover any part of the animal from far, REMEMBER we are shooting small targets at far distances and the more we can see the better. This style of crosshair is best for me.

Here is a target that I sighted in on at 80m and as you can see the grouping is amazing **ALSO remember this group was fired in total darkness!**

By using night vision - it will assist you in achieving far more results, operating in total darkness helps me a lot, and between you and a predator he has nothing to spook him, and as I say he comes in faster, closer, easier and far more determined.

Give the night vision a go, you will not be sorry! Although many don't believe it, predators become accustomed to the red light, but now you are using **ZERO lights at all!**
