

# JACKAL APPROACH ANGLES

These are taken from actual hunts, my last 4 jackal we killed – here is an exact plan of the hunt and how they came into us when using two Foxpro callers, they get totally confused and make a lot of mistakes, see how they responded. This is from actual hunts, NOT made up stuff. Using two callers confuses them and it really helps.

Food Caller # 80m into wind  
 Barking Caller ^^^ 20m on downwind side and 30m into lands  
 Jackal (000).....

(000).....

This female jackal came in behind us, across our front, and was totally on the wrong side of the wind, unlucky her. As usual I used a Chicken distress and social bark on the other caller. It took 9 minutes to drop her.

This system has proved amazing for confusing dogs, as they now have 2 choices to respond to and it is basically in their way so they tend to respond to it before going downwind.

## 2<sup>nd</sup> Hunt

This male came along the road, again also very wrong, and we killed him 23m from the Foxpro.

## 3<sup>rd</sup> Hunt

This was pretty much like the other hunt, just wind was at a slight more acute angle, but this dog also made a mistake.

## 4<sup>th</sup> Hunt

#

This male jackal got it all very wrong, he was (7 years old) but made a direct run for the sound, he never worried about scent etc, he heard that fighting jackal sound and rushed on in.

## 5<sup>th</sup> Hunt

This jackal came at the wrong end, he heard the food and a social sound, then I played a fight and he ran like hell, came in and wanted to kick the others ass as they fought over a rabbit in his area, he never worried about wind, and because of that it cost him dearly.

**USING TWO CALLERS HAS PROVEN TO REALLY CONFUSE THE JACKALS, IT WORKS!**
