

## NIGHT VISION RANGES WITH LASER

This is to give you an estimation of range achieved when using the **LONG RANGE INFRA RED ILLUMINATOR**.

**Firstly do not confuse the laser with a normal red or green laser devise, this is an INFRA RED laser.**

**This laser used in combination with my night vision binoculars extends my visual range by hundreds of metres. Here are a few photos showing ranges and what I saw and the area they got seen.**

This photo, the left down to the fence is 46m, across the open field up towards the green trees is another 330m as the field runs down the other side again to the trees, so this photo makes it look so close by its not, it is from the bakkie to the trees just short of 400m. This photo is very misleading; it looks like a short distance but is much further than it looks.

Last night I used the laser after seeing eyes in the trees, I turned on the laser and turned the focus on the laser to a half way setting (as you turn the setting it goes from a flood visual look, to more narrower and concentrated, BUT the more concentrated the circle of light it throws the more clearly you can see an item at far ranges).

At that distance with the infra red laser I could see a genet sitting in the tree with no problem at all (I was using a 1<sup>st</sup> generation night vision binoculars last night).

Behind the bakkie is a dam, you can see the wall, it is 120m away, and behind that a farmhouse, that's 480m away. Look right of the farmhouse, you can see a dot, that's a power line upright, last night I picked up eyes in front of that, after concentrating my light towards it I could see 4 bulls clearly. This is how powerful this night vision device is. Last night calling was not good and all that appeared was 4 bat eared foxes, they stood at about 100m short of that farmhouse, putting them at 380m, at that range I could see them clearly.

I am using a normal night vision binocular with the laser, and my shooting light is on my gun and also on my chair, I have them on its dimmest, and follow a predator in, when I am sure he is close enough I put down the binocular and turn up the red light and shoot on dim, this works well for me, so a small battery lasts me all night. I don't use rifle night vision sights, most of them are not good enough to see well enough and far enough and to shoot accurately at night.

By using the laser gives you so much more range, it is hard to explain until you personally see it yourself, many people say NO don't waste money with 1<sup>st</sup> generation its rubbish, BUT I tell you this – I challenge anybody to look through my binoculars on a pitch dark night and after that say that is crap! BECAUSE you will be shocked as to what and how far you can see.

I have shown many people on hunts and courses this set up, so far everybody on first look said either – MOER!, WOW or shucks! So, point proven!!

In this picture you can see my small 12V battery under the seat - It gives me an all night hunt as I only use it to shoot and it hardly draws much current.

My dimmers I have made with no on and off switch and they are totally off with dimmed down all the way, it draws no current at all.

I prefer dimmers with less buttons on them, less noise at night and fewer things to go wrong!
